

1                           ABSTRACT

2         The instant invention involves the use of a combination  
3         of preparatory steps in conjunction with mass spectroscopy  
4         and time-of-flight detection procedures to maximize the  
5         diversity of biopolymers which are verifiable within a  
6         particular sample. The cohort of biopolymers verified within  
7         such a sample is then viewed with reference to their ability  
8         to evidence at least one particular disease state; thereby  
9         enabling a diagnostician to gain the ability to characterize  
10       either the presence or absence of said at least one disease  
11       state relative to recognition of the presence and/or the  
12       absence of said biopolymer.
